Reinforcment

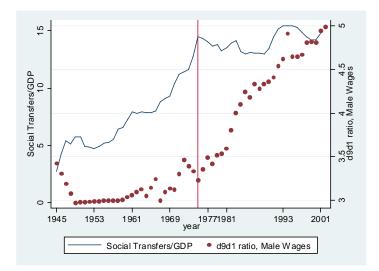

Enhancement:

A shift in inequality leads to endogenous adjustments changing inequality in the same direction.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

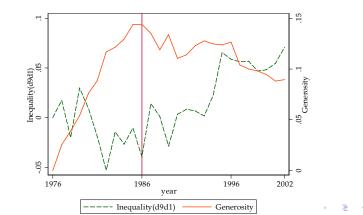

U.S welfare generosity and wage dispersion 1945-2002

◆ロト ◆昼 ト ◆臣 ト ◆臣 ト ● ● の Q ()・

European welfare generosity and wage dispersion 1976-2002

 Inequality depends on public policy G and the productivity dispersion P (γ a shift parameter)

$$I = I(G, P; \gamma)$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

 Inequality depends on public policy G and the productivity dispersion P (γ a shift parameter)

$$I = I(G, P; \gamma)$$

 Productivity dispersion depends on inequality *I* and public policy *G*

$$P=P(I,G)$$

 Inequality depends on public policy G and the productivity dispersion P (γ a shift parameter)

$$I = I(G, P; \gamma)$$

 Productivity dispersion depends on inequality *I* and public policy *G*

$$P=P(I,G)$$

 Public policy depends on inequality and average productivity P_a

$$G = G(I, P_a)$$

Differentiating

$$\frac{dI}{d\gamma} = \frac{1 - P_g G_p}{D} I_{\gamma}$$
$$\frac{dG}{d\gamma} = \frac{G_i + P_i G_p}{D} I_{\gamma}$$
$$\frac{dP}{d\gamma} = \frac{P_i + P_p G_i}{D} I_{\gamma}$$

<□ > < @ > < E > < E > E のQ @

Differentiating

$$\frac{dI}{d\gamma} = \frac{1 - P_g G_p}{D} I_{\gamma}$$
$$\frac{dG}{d\gamma} = \frac{G_i + P_i G_p}{D} I_{\gamma}$$
$$\frac{dP}{d\gamma} = \frac{P_i + P_p G_i}{D} I_{\gamma}$$

 $D = 1 - [P_g G_p + I_g G_i + I_p P_i + G_i P_g I_p + G_p P_i I_g] < 1$

Fix $G = \overline{G}$

$$I = I(\bar{G}, P(I, \bar{G}); \gamma)$$

• Fix $G = \overline{G}$

$$I = I(\bar{G}, P(I, \bar{G}); \gamma)$$
$$\frac{dI}{d\gamma} = \frac{I_{\gamma}}{1 - I_{p}P_{i}}$$

enhanced if $0 < I_p P_i < 1$

Fix $G = \overline{G}$

$$I = I(\bar{G}, P(I, \bar{G}); \gamma)$$

$$\frac{dI}{d\gamma} = \frac{I_{\gamma}}{1 - I_{p}P_{i}}$$

wage in period s in vintage t

$$W(s,t) = Q(s) + \alpha \xi F(t)$$

Free entry $\Pi(t, t) = B(n(t), t)$

profits of a job invested in at time t

$$\Pi(t,t) = \theta(t)F(t) - \sum_{s=t}^{t+\theta(t)-1} W(s,t)$$

wage in period s in vintage t

$$W(s,t) = Q(s) + \alpha \xi F(t)$$

- Free entry $\Pi(t, t) = B(n(t), t)$
- Free exit: termination of jobs of age $\theta(t)$:

$$(1-\alpha\xi)F(t-\theta(t)+1)-Q(t)=0$$

 \blacktriangleright pace of creative destruction λ

• pace of creative destruction λ

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

• full employment $\theta n = 1$

- pace of creative destruction λ
- full employment $\theta n = 1$
- ▶ fatness *n*: free entry $(1/n)f \tilde{w} = b(n) \rightarrow$

$$\pi(n,\lambda) \equiv (1-\alpha\xi) \left[(1/n) - x(1/n) \right] f = b(n)$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- pace of creative destruction λ
- full employment $\theta n = 1$
- ▶ fatness *n*: free entry $(1/n)f \tilde{w} = b(n) \rightarrow$

$$\pi(n,\lambda) \equiv (1-\alpha\xi) \left[(1/n) - x(1/n) \right] f = b(n)$$

► ξ down \Rightarrow *n* up, θ down, a higher level of income per capita *n*x and a higher average wage \bar{w}

direct wage compressing effect is strengthened via structural change and reallocation of workers

- direct wage compressing effect is strengthened via structural change and reallocation of workers
- a lower local bargaining power yields a higher average wage

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- direct wage compressing effect is strengthened via structural change and reallocation of workers
- ► a lower local bargaining power yields a higher average wage
- Piketty on the head: local wage restraints raises expected profits higher investment more wage equality

- direct wage compressing effect is strengthened via structural change and reallocation of workers
- ► a lower local bargaining power yields a higher average wage
- Piketty on the head: local wage restraints raises expected profits higher investment more wage equality
- Strange coalitions: beneficiaries low paid workers together with employers (ends against the middle)

- direct wage compressing effect is strengthened via structural change and reallocation of workers
- ► a lower local bargaining power yields a higher average wage
- Piketty on the head: local wage restraints raises expected profits higher investment more wage equality
- Strange coalitions: beneficiaries low paid workers together with employers (ends against the middle)

 higher rate of technological change increases wage compression via structural change

- direct wage compressing effect is strengthened via structural change and reallocation of workers
- ► a lower local bargaining power yields a higher average wage
- Piketty on the head: local wage restraints raises expected profits higher investment more wage equality
- Strange coalitions: beneficiaries low paid workers together with employers (ends against the middle)
- higher rate of technological change increases wage compression via structural change
- ▶ to the extent that λ depends on n, wage compression implies higher growth and more compression

heterogenous workers

Sorting

$$P_{H}F(\theta_{H}) - w_{H} = p_{L}F(\theta_{H}) - w_{L}$$
$$p_{L}F(\theta_{H} + \theta_{L}) = w_{L}$$

The wage distribution support efficient sorting has $\beta = 1$

$$rac{w_H - w_L}{w_L} = eta rac{p_H - p_L}{p_L} (1 + \lambda)^{ heta_L}$$

Norway S.D.	1997 .35	2001	2005

(ロ)、

Political Reinforcement

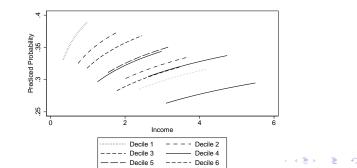

Political reinforcement: Welfare spending as a normal and inferior good

Individual social preferences over disposable income $C_i = (1 - t)w_i$ and welfare spending G- contingent on the social parameter h_i :

- $V_i = v(C_i, G; h_i)$ for members of income class *i*
- v quasi concave utility function, for instance

$$V_i = U((1-t)w_i) + h_i G \equiv V_i(G; w_i)$$

Figure : Social Welfare Should be Expanded. Predicted probabilities

with party platforms G_L and G_R, voters in income class i for whom

$$\Delta_i = V_i(G_L, w_i) - V_i(G_R, w_i) \geq \epsilon_i$$

vote left

Competition within and between parties

Factions:

- ► The idealists Preferences W_L(g) in the left party, and W_R(g) in the right party.
- ► The opportunists, Preference q for the left and (1 q) for the right party

Must have consent by both factions

$$N_L(G_L, G_R) = [q(G_L, G_R)]^{\alpha_L} [W_L(G_L) - W_L(G_R))]^{1-\alpha_L}$$

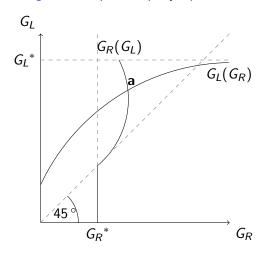

$$N_R(G_L, G_R) = [1 - q(G_L, G_R)]^{\alpha_R} [W_R(G_R) - W_R(G_L))]^{1-\alpha_R}$$

Mixed cooperative non-cooperative game: The equilibrium: \tilde{G}_L , \tilde{G}_R that fit in the internal bargaining solution, and that are consistent best responses to the program of the opposing party, i.e. where

$$\max_{G_L} N_L(G_L, \tilde{G}_R) = N_L(\tilde{G}_L, \tilde{G}_R)$$
$$\max_{G_R} N_R(\tilde{G}_L, G_R) = N_R(\tilde{G}_L, \tilde{G}_R)$$

(PUNE, Roemer)

Figure : The political party equilibrium

・ロト ・雪 ト ・ ヨ ト ・ ヨ ト

æ

As long as the bargaining power of the realists is positive, $\beta_j > 0$ for j = R, L, a mean preserving compression of wages raises the welfare generosity of the political programs of both sides of the political spectrum.

Economic Reinforcement: Empowerment of welfare spending

Nash-product $[V_i^e - V_i^u]^{\alpha_i} [p_i - w_i]^{1-\alpha_i}$

$$V_i^e - V_i^u = \gamma_i [U(c_i) - \delta_i U(\bar{c}_i) - (1 - \delta_i) U(g)]$$

where $\bar{c}_i = (1 - bg)\bar{w}_i$ and U is CRRA with μ .

- $\mu < 1$ higher g reduce pre tax wage gap
- ▶ $\mu \ge 1$ higher g reduce the pre-tax wage inequality $I = w_s/w_\omega$ between any weak group ω , with $\alpha_\omega \le 1/\mu$, and any group s with a more productive job.

Coordination: all wages in income class *i* are set simultaneously. Nash product max_{wi} [U(c_i) − δ_iU(c̄_i) − (1 − δ_i)U(g)]^{α_i} [p_i − w_i]^{1−α_i} is replaced by

$$\max_{w_i}(1-\delta_i)\left[U(c_i)-U(g)\right]^{\alpha_i}\left[p_i-w_i\right]^{1-\alpha_i}$$

 Coordination means that one source of heterogeneity different outside job opportunities— does no longer affect wages: Differentials across jobs become smaller. Political and Economic Reinforcement combined

Inequality Multiplier

Table : Generosity and Inequality. IV-regressions

	(1)	(2)	(3)	(4)
	Inequality	Generosity	Inequality	Unemployment
				generosity
Generosity	-0.374**			
	(0.147)			
Inequality		-1.190**		-1.097**
		(0.235)		(0.367)
Unemployment			-0.296**	
generosity			(0.126)	
F-value first step	39.30	15.11	13.26	15.11
